

Introduction

This free set of fullscreen shaders for procedural edge detection allows you to create clean, customizable outlines around every 3D object in your scene.

They are designed for game developers who want to give their game a more cartoon-style look. To use them, place the files from the archive into your *Unity* project. Then follow the step-by-step video tutorial to set them up for your project.

If you have any questions, feel free to ask them in the comments under the video, and I'll be happy to answer them.

Technical details

This shader works in *Unity* starting from version 2022.3.62.

Shader Parameters:

- *Outline Color* – base color of the outline;
- *Thickness* – defines the width of the outline in pixels;
- *Depth Threshold* – sensitivity of the edge detection;
- *Normal Threshold* – sensitivity of the geometric angle detection;
- *Screen Margin* – safety buffer measured in pixels from the edge of the screen.

Because edge detection needs to sample "neighboring" pixels, it can produce artifacts (false lines) at the very edges of the viewport where no neighbor data exists. The *Screen Margin* parameter forces the shader to ignore the outermost edges of the screen, ensuring a clean frame.
